

Estimate – Weigh – Discover

Climate protection in everyday life: What matters? Find out!

What is the climate scale?

The climate scale shows different cans that represent typical everyday actions – from „install balcony power plant“ to „use a water-saving shower head“ up to „vegan diet“.

Each can shows how much CO₂ you can save per year.

How it works:

Estimate

Which cans are light and which are heavy? (without lifting them up!)

Exchange

Discuss with others why you think that way.

Weigh

Place one can on the scale and compare it to the others.

Combine

Find out which actions make the biggest difference.

→ **Special assignment:** Who can find the lightest and the heaviest can?

To think further

What actions are you already taking?

Which ones could you implement in the future – and which not? Why?
